

Preventive Medicine Program at Wofford College

Animal Procurement: All animals will be procured from qualified laboratory animal suppliers (e.g. rodents procured from Charles River Laboratories; pigeons procured from Palmetto Pigeon Plant).

Quarantine: In the event that an animal shows signs of disease or injury, that animal will be housed singularly in a cage and isolated from the other animals in the colony until the attending veterinarian can examine the animal and make further recommendations. In the case of a transmittable disease, the animal will be placed in quarantine from the other animals in the colony until no risk of transmission exists.

Species separation: All animals are separated by species in individual colony rooms. No two different breeds of a species are to be housed in the same caging unit.

Minimization of introducing and or spreading disease: Before entering and after exiting a colony room, personnel are required to wash their hands remove any soiled clothing prior to entering another colony room.
